 WARNING

This service information is designed for experienced repair technicians only and is not designed for use by the general public. It does not contain warnings or cautions to advise non-technical individuals of potential dangers in attempting to service a product. Products powered by electricity should be serviced or repaired only by experienced professional technicians. Any attempt to service or repair the product or products dealt with in this service information by anyone else could result in serious injury or death.

IMPORTANT SAFETY NOTICE

There are special components used in this equipment which are important for safety. These parts are marked by  in the Schematic Diagrams, Circuit Board Diagrams, Exploded Views and Replacement Parts List. It is essential that these critical parts should be replaced with manufacturer's specified parts to prevent shock, fire or other hazards. Do not modify the original design without permission of manufacturer.

IMPORTANT INFORMATION ABOUT LEAD FREE, (PbF), SOLDERING

If lead free solder was used in the manufacture of this product, the printed circuit boards will be marked PbF. Standard leaded, (Pb), solder can be used as usual on boards without the PbF mark. When this mark does appear, please read and follow the special instructions described in this manual on the use of PbF and how it might be permissible to use Pb solder during service and repair work.

- When you note the serial number, write down all 11 digits. The serial number may be found on the bottom of the unit.
- The illustrations in this Service Manual may vary slightly from the actual product.

Note for TABLE OF CONTENTS:

Because sections 5, 6 and 7 of this manual are extracts from the operating instructions for this model, they are subject to change without notice. You can download and refer to the original operating instructions on TSN Server for further information.

1 Safety Precautions

1.1. For Service Technicians

ICs and LSIs are vulnerable to static electricity.

When repairing, the following precautions will help prevent recurring malfunctions.

1. Cover plastic parts boxes with aluminum foil.
2. Ground the soldering irons.
3. Use a conductive mat on worktable.
4. Do not grasp IC or LSI pins with bare fingers.

2 Warning

2.1. Battery Caution

1. Danger of explosion if battery is incorrectly replaced.
2. Replace only with the same or equivalent type recommended by the manufacturer.
3. Dispose of used batteries according to the manufacture's Instructions.

2.2. About Lead Free Solder (PbF: Pb free)

Note:

In the information below, Pb, the symbol for lead in the periodic table of elements, will refer to standard solder or solder that contains lead.

We will use PbF solder when discussing the lead free solder used in our manufacturing process which is made from Tin (Sn), Silver (Ag), and Copper (Cu).

This model, and others like it, manufactured using lead free solder will have PbF stamped on the PCB. For service and repair work we suggest using the same type of solder.

Caution

- PbF solder has a melting point that is 50°F ~ 70° F (30°C ~ 40°C) higher than Pb solder. Please use a soldering iron with temperature control and adjust it to 700°F ± 20° F (370°C ± 10°C).
- Exercise care while using higher temperature soldering irons.: Do not heat the PCB for too long time in order to prevent solder splash or damage to the PCB.
- PbF solder will tend to splash if it is heated much higher than its melting point, approximately 1100°F (600°C).
- When applying PbF solder to double layered boards, please check the component side for excess which may flow onto the opposite side (See the figure below).

2.2.1. Suggested PbF Solder

There are several types of PbF solder available commercially. While this product is manufactured using Tin, Silver, and Copper (Sn+Ag+Cu), you can also use Tin and Copper (Sn+Cu), or Tin, Zinc, and Bismuth (Sn+Zn+Bi). Please check the manufacturer's specific instructions for the melting points of their products and any precautions for using their product with other materials.

The following lead free (PbF) solder wire sizes are recommended for service of this product: 0.3 mm, 0.6 mm and 1.0 mm.

0.3 mm X 100 g	0.6 mm X 100 g	1.0 mm X 100 g

4 Technical Descriptions

4.1. FHSS Description

4.1.1. Frequency

The frequency range of 2.4 GHz - 2.48 GHz is used. Transmitting and receiving channel between base unit and handset is same frequency. Refer to **Frequency Table** (P.79).

4.1.2. FHSS (Frequency Hopping Spread Spectrum)

This telephone is using an IC chip which has similar specification to WDCT (World Digital Cordless Telephone) and is the telephone system that can use multiple portable unit simultaneously. The explanation of this system is mentioned below. This system uses a Time Division Multiple Access/Time Division Duplex (**TDMA/TDD**) scheme:

transmitting and receiving frequencies of the base unit and handset are shared in the same frequency. The construction of RX/TX frequency data is shown below. It consists of 4 slots from the base unit to the handset, and 4 slots from the handset to the base unit, total 8 slots in 10 ms. By this slot system, simultaneous air link and communication between 4 handsets and the base unit can be realized. One communication between handset and the base unit is done by one slot from the base unit to handset, and another slot from handset to the base unit.

DSS makes spectrum spread by multiplying carrier signal by PN code. The purpose to make spectrum spread is to reduce power density per time and per band. On the other hand, **FHSS** makes spectrum spread by changing channel every 10 ms according to Hopping table. Also the purpose to make spectrum spread is to reduce power density per time and per band.

4.1.2.1. TDD Frame Format

Sync Field (72 bit): Preamble 56 bit + SyncWord 16 bit

Base unit (handset) adjusts the timing of reception so that reception of base unit (handset) can correspond to transmission of handset (base unit).

It is necessary for sync-field that handset gets synchronization.

A - field (64 bit): Each kinds of DATA: ch data, line condition, etc.

B - field (320 bit + 80 bit): Sound data + parity

Z - field (4 bit): Parity Check

4.1.2.2. TDMA system

This system is the cycles of 10 ms, and has four duplex paths,

so it is possible to perform four duplex communications simultaneously.

In 1 slot 1.25 ms, the 10 ms of voice data is transmitted.

Each slot makes every frame frequency hop. (100 hops/sec.)

Although each slot (UpLink3 and UpLink4) uses different frequency, UpLink3 and DownLink3 use the same frequency.

• 2 - Handsets Link

Traffic Bearer

A link is established between base unit and handset.

The state where duplex communication is performed.

The hopping pattern of a 1800 hops (18 seconds) cycle.

Dummy Bearer

The base unit sends Dummy-data to the all stand-by state handsets.

The handsets receive that data for keeping synchronization and monitoring request from the base unit.

Dummy Bearer doesn't contain B-field (sound) data.

4.1.3. Signal Flowchart in the Whole System

Reception

CN101 of the base unit is connected to the TEL line, and signal is entered through the bridge diode D101. While talking, the relay (Q141) is turned ON and amplified at the Q171, then led to DSP (IC501). The DSP encodes ADPCM and TDD/TDMA with FHSS to TX-DATA. The TX-DATA signal is entered to IC701 of RF UNIT, and modulated to 2.4 GHz. The RF signal is fed into Tx/Rx switch (D704). The RF signal is passed through filter (FL701) and fed to Antenna.

As for the handset, RF signal from the antenna passes through filter (FL701), then is routed by Tx/Rx switch (D704) and led to IC701. The RF signal is amplified by LNA and down-converted to IF signal in IC701. The IF signal passing through internal filter is demodulated into RX-DATA, then enters DSP (IC501). The DSP performs TDD/TDMA and ADPCM decoding to convert the RX-DATA into the voice signal, then it is output to the speaker.

Transmission

The voice signal entering from the microphone is led to DSP (IC501). The DSP encodes ADPCM and TDD/TDMA with FHSS to TX-DATA. The TX-DATA signal enters IC101 of RF UNIT, and is modulated to 2.4 GHz. The RF signal is fed into Tx/Rx switch (D704). The RF signal is passed through filter (FL701) and fed to Antenna.

As for the base unit, RF signal from the Antenna passes through filter (FL701), then is routed by Tx/Rx switch (D704) and led to IC701. The RF signal is amplified by LNA and down-converted to IF signal in IC701. The IF signal passing through internal filter is demodulated, then enters DSP (IC501). The DSP performs TDD/TDMA and ADPCM decoding to convert the RX-DATA into the voice signal. The voice signal is amplified at the TX amplifier (Q161), then output to the TEL line CN101 through the relay (Q141) and bridge (D101).

4.2. Explanation of Link Data Communication

4.2.1. Calling

When calling, a communication request DATA (CC-SETUP) is transmitted from the handset, and a permitting DATA (CC-CONNECT) is returned from the base unit to it. At that time the audio path opens.

4.2.2. To Terminate Communication

When the OFF button on the handset is pressed during communication, a LINK terminating DATA (CC-RELEASE) is sent to terminate the communication. Then DATA (CC-RELEASE-COM) is returned from base unit. Handset receives it and reset the link.

4.2.3. Ringing

When the bell signal is detected, the base unit sends "GR-PAGE-REQ (Bell start)". Then receiving the bell data from the base unit causes to ring the bell of the handset.

4.3. Block Diagram (Base Unit_Main)

KX-TG3521/3522 BLOCK DIAGRAM (Base Unit_Main)

4.4. Block Diagram (Base Unit_RF Part)

KX-TG3521/3522 BLOCK DIAGRAM (Base Unit_RF Part)

4.5. Circuit Operation (Base Unit)

General Description:

(DSP, EEPROM) is a digital speech/signal processing system that implements all the functions of speech compression and memory management required in a digital telephone.

The DSP system is fully controlled by a host processor DSP. The host processor provides activation and control of all that functions as follows.

4.5.1. DSP (Digital Speech/Signal Processing: IC501)

- **DTMF Detection/Generator**

The DTMF detection is implemented by the DSP system in software. The DTMF detection is performed during Line Monitoring modes of operation.

When the DTMF data from the Handset is received, the DTMF signal is output.

- **Caller ID demodulation**

The DSP implements monitor and demodulate the FSK signals that provide CID information from the Central Office.

- **Digital Switching**

The voice signal from telephone line is transmitted to the handset or the voice signal from the handset is transmitted to the Telephone line, etc. They are determined by the signal path route operation of voice signal.

- **Block Interface Circuit**

RF part, LED, Key scan, Telephone line.

4.5.2. EEPROM (IC611)

Following information data is stored.

- **Settings**

ex: ID code, Flash Time, Tone/Pulse

4.5.3. Power Supply Circuit

Function:

The power supply voltage from AC adaptor is converted to the desired voltage of each block.

Circuit Operation:

- Q300 and IC300: 4.0 V DCDC Converter
- IC331: 3.3 V Regulator

4.5.3.1. Charge Circuit

The voltage from the AC adaptor is supplied to the charge circuits.
The charge is controlled by the handset.

4.5.4. Reset Circuit

Function:

This circuit is used to initialize the microcomputer when it incorporates an AC adaptor.

Circuit Operation:

When the AC Adaptor is inserted into the unit, then the voltage is shifted by IC331 and power is supplied to the DSP.

The set starts to operate when VCC goes up to 3.0 V or more in the circuit voltage diagram.

Note:

(*1) The initializing time of the DSP chip is 28 ms under normal conditions.

4.5.5. Telephone Line Interface

Telephone Line Interface Circuit:

Function

- Bell signal detection
- ON/OFF hook and pulse dial circuit
- Side tone circuit

Bell signal detection and OFF HOOK circuit:

In the idle mode, Q141 is open to cut the DC loop current and decrease the ring load. When ring voltage appears at the Tip (T) and Ring (R) leads (When the telephone rings), the AC ring voltage is transferred as follows:

T → L101 → R111 → C111 → Q111 → DSP pin 58 [BELL]

When the CPU (DSP) detects a ring signal, Q141 turns on, thus providing an off-hook condition (active DC current flow through the circuit). Following signal flow is the DC current flow.

T → L101 → D101 → Q141 → Q161 → R163 → D101 → L102 → P101 → R

ON HOOK Circuit:

Q141 is open, Q141 is connected as to cut the DC loop current and to cut the voice signal. The unit is consequently in an on-hook condition.

Pulse Dial Circuit:

Pin 59 of DSP turns Q141 ON/OFF to make the pulse dialing.

Side Tone Circuit:

Basically this circuit prevents the TX signal from feeding back to RX signal. As for this unit, TX signal feed back from Q161 is canceled by the canceller circuit of DSP.

4.5.6. Parallel Connection Detect Circuit

Function:

In order to disable call waiting and stutter tone functions when using telephones connected in parallel, it is necessary to have a circuit that judges whether a telephone connected in parallel is in use or not. This circuit determines whether the telephone connected in parallel is on hook or off hook by detecting changes in the T/R voltage.

Circuit Operation:

Parallel connection detection when on hook:

When on hook, the voltage is monitored at pin 86 of IC501. There is no parallel connection if the voltage is 1.65 V or higher, while a parallel connection is deemed to exist if the voltage is lower.

Parallel connection detection when off hook:

When off hook, the voltage is monitored at pin 90 of IC501; the presence/absence of a parallel connection is determined when the voltage changes by 0.2 V or more.

4.5.7. Calling Line Identification (Caller ID)

Function:

The caller ID is a chargeable ID which the user of a telephone circuit obtains by entering a contract with the telephone company to utilize a caller ID service. For this reason, the operation of this circuit assumes that a caller ID service contract has been entered for the circuit being used.

The Caller-ID data from exchange is supplied to the telephone using either method of FSK or DTMF. The method is chosen according to the exchange of telephone office. This unit is available to receive the data with both methods and displays the received data on LCD.

• FSK (Frequency Shift Keying) format

• DTMF format

It is the method to send the telephone number of calling party with DTMF to the telephone. DTMF is sent before the first bell signal.

The data is sent in turn; first the start code, secondly the telephone number of calling party, lastly end code.

The DTMF is chosen from A (1633 Hz and 697 Hz), B (1633 Hz and 770 Hz), C (1633 Hz and 852 Hz) and D (1633 Hz and 941 Hz) as the start code and end code according to the exchange.

4.6. Block Diagram (Handset)

KX-TGA351 BLOCK DIAGRAM (Handset)

4.7. Block Diagram (Handset_RF Part)

4.8. Circuit Operation (Handset)

4.8.1. Construction

The circuit mainly consists of DSP and RF part as shown in the block diagram.

4.8.1.1. DSP: IC501

Function

- Battery Low, Power down detect circuit
 - Ringer Generation
 - Interface circuit
- RF part, Speaker, Mic, LED, Key scan, LCD, Headset

Initial waves

Note:

(*1) The initializing time of the DSP chip is 20 ms under normal conditions.

4.8.1.2. RF part

Mainly voice signal is modulated to RF, or it goes the other way.

4.8.1.3. EEPROM: IC541

All setting data is stored.

ex: ID code, user setting (Phonebook, Caller ID data)

4.8.2. Power Supply Circuit

Voltage is supplied separately to each block.

Block Diagram (Handset Power)

4.8.3. Charge Circuit

When the handset is put on the cradle of the base unit or the charger, the power is supplied from CHARGE+ and CHARGE- terminals to charge the battery via D361 and R366 or Q361. The voltage between CHARGE+ and CHARGE- flows R531 → Q531 → pin 38 of IC501, where the charge is detected. Then IC501 calculates the battery consumption amount from the previous charge, and it controls Q361/Q362/Q363 by pin 80 of IC501 until charging is complete. When charging is complete, the control pattern is switched to Trickle charging form from Operational charging form.

Charging-form

•Main charge

•Trickle charge

Pin 88 of IC501 monitors the battery voltage and detect BATT LOW at 3.50 V.

4.8.4. Ringer and Handset SP-Phone

4.8.5. Sending Signal

The voice signal from the microphone is input to DSP (90, 91). CN431 is the headset jack. When the headphone is connected, the Q431 detect it. The input from the microphone of the handset (MIM, MIP) is cut and the microphone signal from the headset is input to DSP (95). Also the power for the microphone is supplied from DSP (92) and the power is turned OFF on standby.

4.8.6. Reception Signal

The voice signal from the base unit is output to DSP (98). This signal is led to the headset jack (CN431). The signal through the headset jack and the other signal output from DSP (97) drives the speaker. When the headset is inserted to the jack, the voice signal is cut at the jack, so the sound does not come out from the speaker, but from the headset only.

4.9. Circuit Operation (RF Part)

General Description:

RF part includes Transmitter and Receiver functions. Digital signals (Mainly voice data) that come from DSP, are modulated and are transmitted. On the other hand, received signals are demodulated and go out to DSP.

4.9.1. 2.4GHz Mod/Demod Circuit (Base Unit RF Part)

IC701 incorporates all of the modulation and demodulation functions. TX Digital data (TX_DATA) from DSP is supplied to pin 27 of IC701, and then 2.4 GHz TX modulated signal is output from pin 1. This TX signal is filtered by BPF (FL701) and supplied to Antenna. 2.4 GHz RX signal from the Antenna is filtered by BPF (FL701) and supplied to pin 4 of IC701, then demodulated signal (RX_DATA) comes out from pin 16. At the same time, RSSI (Received Signal Strength Indicator) outputs from pin 14. Reference clock (13.824 MHz) from DSP block is supplied to pin 11 of IC701. V_PA and V_RF supply 2.5 V regulated voltage.

Note:

The exposed GND_PLATE on the bottom of the IC701 supplies the circuit ground(s) for the entire chip. It is very important that a good solder connection is made between this GND_PLATE and the ground plane of the PCB underlying the IC701.

4.9.2. 2.4GHz Mod/Demod Circuit (Handset RF Part)

IC701 incorporates all of the modulation and demodulation functions. TX Digital data (TX_DATA) from DSP is supplied to pin 27 of IC701, and then 2.4 GHz TX modulated signal is output from pin 1. This TX signal is filtered by BPF (FL701) and supplied to Antenna. 2.4 GHz RX signal from the Antenna is filtered by BPF (FL701) and supplied to pin 4 of IC701, then demodulated signal (RX_DATA) comes out from pin 16. At the same time, RSSI (Received Signal Strength Indicator) outputs from pin 14. Reference clock (13.824 MHz) from DSP block is supplied to pin 11 of IC701. V_RF supplies 2.5 V regulated voltage. V_PA supplies 3.3 V regulated voltage.

Note:

The exposed GND_PLATE on the bottom of the IC701 supplies the circuit ground(s) for the entire chip. It is very important that a good solder connection is made between this GND_PLATE and the ground plane of the PCB underlying the IC701.

4.10. Circuit Operation (Charger Unit)

The voltage from the AC adaptor is supplied to the charge circuits. Main charge (180~250 mA at the Battery) of maximum 7-hours is started soon after the handset is placed on the charger unit. Then it changes to Trickle charge to prevent from over-charging.

Charging-form

• Main charge

• Trickle charge

The route for this is as follows: DC+pin of CN1 → R1 ~ R5, R7 ~ R13 → CHARGE+pad → Handset → CHARGE-pad → DC-pin of CN1.

4.11. Signal Route

SIGNAL ROUTE	IN	→	ROUTE	→	OUT
HANDSET TX	HANDSET MIC - C414/C415 - RA401 - IC501(91/90 - 20) - <HANDSET_RF_TX_ROUTE> - ANT. --- ---ANT. - <BASE_UNIT_RF_RX_ROUTE> - IC501(34 - 97) - R183 - C185 - R185 - Q161 - Q141 - D101 - L101/[L102 - P101] - CN101(TEL LINE)

6 Installation Instructions

6.1. Setting Up the Base Unit

6.1.1. Connecting the AC Adaptor and Telephone Line Cord

Connect the telephone line cord until it clicks into the base unit and telephone line jack (❶). Connect the AC adaptor cord (❷) by pressing the plug firmly (❸).

- Use only the included Panasonic AC adaptor PQLV203BXZ.

Note:

- The AC adaptor must remain connected at all times. (It is normal for the adaptor to feel warm during use.)
- The AC adaptor should be connected to a vertically oriented or floor-mounted AC outlet. Do not connect the AC adaptor to a ceiling-mounted AC outlet, as the weight of the adaptor may cause it to become disconnected.
- When more than one unit is used, the units may interfere with each other. To prevent or reduce interference, please keep ample space between the base units.
- The unit will not work during a power failure. We recommend connecting a corded telephone to the same telephone line or to the same telephone line jack using a T-adaptor.

If you subscribe to a DSL service

Please attach a noise filter (contact your DSL provider) to the telephone line between the base unit and the telephone line jack in the event of the following:

- Noise is heard during conversations.
- Caller ID features do not function properly.

6.2. Setting Up the Handset

6.2.1. Connecting the AC Adaptor

- Use only the included Panasonic AC adaptor PQLV208BXZ.

6.3. Battery Installation/Replacement

- 1 Press the notch of the handset cover firmly, and slide it in the direction of the arrow.

- If necessary, remove the old battery.

- 2 Insert the battery (❶), and press it down until it snaps into position (❷). Then close the handset cover (❸, ❹).

Important:

- Use only the rechargeable Panasonic battery HHR-P107.

6.4. Battery Charge

Place the handset on the base unit or charger for **7 hours** before initial use.

- While charging, "Charging" is displayed and the charge indicator on the handset lights. When the battery is fully charged, "Charge completed" is displayed.

Base unit:

Charger:

Note:

- If you want to use the handset immediately, charge the battery for at least 15 minutes.
- To ensure that the battery charges properly, clean the charge contacts of the handset, base unit, and charger with a soft, dry cloth. Clean if the unit is subject to the exposure of grease, dust, or high humidity.
- When the battery is empty, "Charge for 7h" is displayed and the charge indicator does not light for about 5 minutes to concentrate on charging.

Note for service:

The battery strength may not be indicated correctly if the battery is disconnected and connected again, even after it is fully charged. In that case, by recharging the battery as mentioned above, you will get a correct indication of the battery strength.

6.4.1. Battery Level

Battery icon	Battery level
	Fully charged
	Medium
	Low Flashing: needs to be recharged.
	Empty

Note:

- When the battery needs to be charged, the handset beeps intermittently during use.

6.4.2. Panasonic Battery Performance

Operation	Operating time
While in use (talking)	Up to 5 hours
While not in use (standby)	Up to 11 days
While using the clarity booster feature	Up to 3 hours

Note:

- Battery operating time may be shortened over time depending on usage conditions and surrounding temperature.
- Battery power is consumed whenever the handset is off the base unit or charger, even when the handset is not in use.
- After the handset is fully charged, displaying "Charge completed", it may be left on the base unit or charger without any ill effect on the battery.
- The battery level may not be displayed correctly after you replace the battery. In this case, place the handset on the base unit or charger and let it charge for 7 hours.

7 Operation Instructions

7.1. Programmable Settings

You can customize the unit by programming the following features using the handset.

To access the features, there are 2 methods:

- scrolling through the display menus
- using the direct commands
- Mainly the direct command method is used in this service manual.

7.1.1. Programming by Scrolling through the Display Menus

- 1 **[MENU]**
- 2 Press **[▼]** or **[▲]** to select the desired menu. → **[Select]**
 - If there is a sub-menu(s), press **[▼]** or **[▲]** to select the desired item. → **[Select]**
- 3 Press **[▼]** or **[▲]** to select the desired setting. → **[Save]**
 - This step may vary depending on the feature being programmed.
- 4 **[OFF]**

Main menu	Sub-menu 1	Sub-menu 2

Voice enhancer	[5]	[1]: On [0]: <Off>	—

*1 If “System setting” column is checked, you do not need to program the same item using another handset.

*2 If you subscribe to Caller ID service and want to view the caller’s information after lifting up the handset to answer a call, turn off this feature.

*3 Turn this feature off if you prefer not to hear key tones while you are dialing or pressing any keys, including confirmation tones and error tones.

*4 The flash time depends on your telephone exchange or host PBX. Consult your PBX supplier if necessary.

*5 Generally, the line mode setting should not be adjusted. If “Line in use” is not displayed when another phone connected to the same line is in use, you need to change the line mode to “A”.

*6 This feature allows the unit to automatically adjust the date and time setting when caller information is received. To use this feature, set the date and time first.

7.2. Copying Handset Phonebook Items

You can copy one or all of the phonebook items from one handset to another.

7.2.1. Copying All Items

- 1 [MENU] → [⇄][2]
- 2 [▼]/[▲]: Select the handset to copy to. → [Send]
- 3 Press [OFF] after the long beep.

7.3. Dial Lock

This feature prohibits making outside calls. The default setting is OFF.

Important:

- When dial lock is turned on, only phone numbers stored in the phonebook as emergency numbers (numbers stored with a # at the beginning of the name) can be dialed using the phonebook. We recommend storing emergency numbers in the phonebook before using this feature.
- When dial lock is turned on, you cannot store, edit, or erase items in the phonebook.

To turn dial lock on

- 1 [MENU] → [6]
- 2 Enter a 4-digit password.*
 - This password is required when turning dial lock off. We recommend writing the password down.
- 3 [Save] → [Yes] → [OFF]

Note:

- If dial lock is turned on, the handset displays "Dial lock".

To turn dial lock off

- 1 [MENU] → [6]
- 2 Enter the same password* that was entered when dial lock was turned on.
- 3 [Save] → [Yes] → [OFF]

For Service Hint:

- *: If the current password is forgotten, enter "726276642" and you will be able to go to next step.

7.4. Error Messages

If the unit detects a problem, one of the following messages is shown on the display.

Display message	Cause/solution
All handsets are registered.	• 4 handsets have already been registered to the base unit. A previously deregistered handset number may still be retained in the base unit. To register an additional handset, erase the unnecessary handset number.
Busy	• The called unit is in use. • The handset you tried to copy phonebook items to is in use. Try again later. • The handset you are calling is too far from the base unit.
Dial locked	• Dial lock is turned on. To turn it off, see "Dial Lock".
Error!!	• The handset's registration has failed. Move the handset and base unit away from all electrical appliances and try again. • Another handset user tried to send phonebook items to you but there was an error. Have the other handset user re-send the items to you. • The entered password was wrong in programming dial lock. Enter the correct password.
---Incomplete--- Phonebook full	• The destination handset's phonebook memory is full. Erase unnecessary items from the destination handset's phonebook.
Invalid	• There is no handset registered to the base unit matching the extension number you entered.
No items stored	• Your phonebook or redial list is empty.
No link to base. Move closer to base, try again.	• The handset has lost communication with the base unit. Move closer to the base unit, and try again. • Confirm that the base unit's AC adaptor is plugged in. • The handset's registration may have been canceled. Re-register the handset.
Phonebook full	• There is no space to store new items in the phonebook. Erase unnecessary items.
Please lift up and try again.	• A handset button was pressed while the handset was on the base unit or charger. Lift the handset and press the button again.
System is busy. Please try again later.	• Other units are in use and the system is busy. Try again later. • The handset's registration may have been canceled. Re-register the handset.

7.5. Troubleshooting

General use

Problem	Cause/solution
The unit does not work.	• Make sure the battery is installed correctly and fully charged. • Check the connections. • Unplug the base unit's AC adaptor to reset the unit. Reconnect the adaptor and try again. • The handset has not been registered to the base unit. Register the handset.
I cannot hear a dial tone.	• Confirm the telephone line cord is properly connected. • Disconnect the unit from the telephone line and connect a known working telephone. If the working telephone operates properly, contact our service personnel to have the unit repaired. If the working telephone does not operate properly, contact your telephone service provider.
The indicator on the top right of the handset flashes slowly.	• New messages have been recorded. Listen to the new messages.

Programmable settings

Problem	Cause/solution
I cannot program items.	• Programming is not possible while either the base unit or another handset is being used. Try again later.
I cannot set the alarm.	• In order to set the alarm, you must first set the date and time. • The handset has lost the communication with the base unit. Move closer to the base unit, and try again.
While programming, the handset starts to ring.	• A call is being received. Answer the call and start again after hanging up.

Battery recharge

Problem	Cause/solution
I fully charged the battery, but  continues to flash, or  is displayed.	• Clean the charge contacts and charge again. • The battery may need to be replaced with a new one.
The handset display is blank.	• Confirm that the battery is properly installed. • Fully charge the battery.
While charging, the charge indicator does not light and "Charge for 7h" is displayed.	• The battery is empty. The charge indicator does not light in order to concentrate on charging. After about 5 minutes, the charge indicator lights and "Charging" is displayed.

Making/answering calls, intercom

Problem	Cause/solution
Static is heard, sound cuts in and out. Interference from other electrical units.	• Move the handset and base unit away from other electrical appliances. • Move closer to the base unit. • Turn on the clarity booster feature. • If your unit is connected to a telephone line with DSL service, we recommend connecting a noise filter between the base unit and the telephone line jack. Contact your DSL provider for details.
The handset does not ring.	• The ringer volume is turned off. Adjust it.
I cannot make a call.	• The dialing mode may be set incorrectly. Change the setting. • Another handset is in use. Try again later. • Dial lock is turned on. To turn it off, see "Dial Lock".
I cannot have a conversation using the headset.	• Make sure that an optional headset is connected properly. • If "SP-phone" is displayed on the handset, press [📞] to switch to the headset.
I cannot page the handset.	• The called handset is too far from the base unit. • The called handset is in use. Try again later.

Caller ID

Problem	Cause/solution
The handset does not display the caller's phone number.	• You have not subscribed to Caller ID service. Contact your telephone service provider to subscribe. • If your unit is connected to any additional telephone equipment such as a Caller ID box or cordless telephone line jack, disconnect the unit from the equipment and plug the unit directly into the wall jack. • If your unit is connected to a telephone line with DSL service, we recommend connecting a noise filter between the base unit and the telephone line jack. Contact your DSL provider for details. • Other telephone equipment may be interfering with this unit. Disconnect the other equipment and try again. • The caller requested not to send caller information.

8 Test Mode

8.1. Adjustment and Test Mode Flow Chart

8.1.1. Test Burst Mode for Base Unit

Note:

(*1) When you check test mode, connect to the external Buttons because base unit has only LOCATOR key. Refer to **Flow Solver Side View** (P.77).

(*2) Refer to **Check Table for RF part** (P.61).

8.1.2. TX-CW Mode for Base Unit

Note:

(*1) When you check test mode, connect to the external Buttons because base unit has only LOCATOR key. Refer to **Flow Sol-der Side View** (P.77).

(*2) Refer to **Check Table for RF part** (P.61).

8.1.3. RX-CW Test Mode for Base Unit

Note:

(*1) When you check test mode, connect to the external Buttons because base unit has only LOCATOR key. Refer to **Flow Solver Side View** (P.77).

(*2) Refer to **Check Table for RF part** (P.61).

8.1.4. Test Link Mode for Base Unit

Note:

- (*1) When you check test mode, connect to the external Buttons because base unit has only LOCATOR key. Refer to **Flow Sol-der Side View** (P.77).
- (*2) Refer to **Test Link Mode for Handset** (P.48). If you can not proceed to the next step, refer to **Registering a Handset** (P.58).
- (*3) Refer to **Check Table for RF part** (P.61).
- (*4) for factory use only.

8.1.5. Adjustment Mode for Base Unit

Cross Reference

Check and Adjust Frequency (Base Unit) (P.75)

Note:

(*1) Refer to the table below, if using Frequency Counter for checking.

BCK	TEST MODE Frequency (1 Channel)
13.824 MHz	→ 2400.724512 MHz
±30 Hz	→ ±5.20 kHz
±100 Hz	→ ±17.36 kHz

8.1.6. Test Burst Mode for Handset

Note:

(*1) LCD displays the Channel number.

(exception: default/ CH00 = 1ch.)

(*2) Refer to **Check Table for RF part** (P.61).

8.1.7. TX-CW Mode for Handset

Note:

(*1) LCD displays the Channel number.

(exception: default/ CH00 = 1ch.)

(*2) Refer to **Check Table for RF part** (P.61).

8.1.8. RX-CW Test Mode for Handset

Note:

(*) LCD displays the Channel number.

(exception: default/ CH00 = 1ch.)

(*) Refer to **Check Table for RF part** (P.61).

8.1.9. Test Link Mode for Handset

Note:

(*) LCD displays the Channel number.

(exception: default/ CH00 = 1ch.)

(*2) If you can not proceed to the next step, refer to **Registering a Handset** (P.58).

(*3) for factory use only.

(*4) Refer to **Check Table for RF part** (P.61).

8.1.10. Adjustment Mode for Handset

Cross Reference

- (*1) **Adjust Battery Low Detector Voltage (Handset)** (P.75)
- (*2) These are the default values.
- (*3) These values may not be fixed depending on the battery strength.
- (*4) Refer to the table below, if using Frequency Counter for checking.

BCK	TEST MODE Frequency (1 Channel)
13.824 MHz	→ 2400.724512 MHz
±30 Hz	→ ±5.20 kHz
±100 Hz	→ ±17.36 kHz

9 Service Mode

9.1. How to Clear User Setting

Units are reset to the Factory settings by this operation (Erase stored Phone numbers, Caller list and etc.).

This operation should not be performed for a usual repair.

9.1.1. Handset

Note:

(*1) Be sure to short the battery terminals of the handset with a lead wire, etc. for 2 seconds for discharge after removing the battery.

- When deregistering all handset by the base unit, refer to **Deregistering All Handsets by the Base Unit** (P.59).

9.2. Copying Phonebook Items when Repairing

You can copy the handset phonebook to another (compatible Panasonic) handset. This will help to save the original phonebook data which the customer has registered.

Refer to the following procedures.

Note:
BS=Base unit
HS=Handset

Case 1: A base unit has a defect.
(Replacing a base unit PCB etc...)

1. Register HS (A) to BS (B).
HS (A) is normal, therefore no need to copy the phonebook data.

Case 2: A base unit has a defect.
(Replacing both a base unit and a handset)

1. Register HS (A) to BS (B) as a handset no. 2.
2. Copy the phonebook data from HS (A) to HS (B).
3. Canceling the HS 2 (HS (A)).

Case 3: A handset has a defect.
(Radio transmission is functioning.)

Case 4: A handset has a defect.
(Radio transmission is functioning.)

Note:

- If the max number of handsets are already registered to the base unit, a new handset cannot be registered.
- To register the handset, refer to **Registering a Handset** (P.58).
- To cancel the handset, refer to **Deregistering a Handset** (P.58).
- To copy the handset phonebook, refer to **Copying Handset Phonebook Items** (P.36)

9.3. Replacing P.C. Board of Base Unit with Used P.C. Board

The base unit can be repaired by replacing the P.C. board with the used P.C. board of KX-TG3521, KX-TG3522 or any other compatible P.C. board. (*1)

The previous handset's ID and user information are stored in the P.C. board of the substitute base unit. They need to be cleared as follows.

9.3.1. For Models with Only 1 Handset Included

- ① Replace the P.C. board (a) by the normal P.C. board (b).
- ② Erase the registration information of P.C. board (b).
 - Refer to **Deregistering All Handsets by the Base Unit** (P.59).
- ③ Register the handset (A-1) to the base unit (A).
 - Refer to **Registering a Handset** (P.58).
- ④ Reset the setting information existed in P.C. board (b).
 - Press **[1]**, **[5]**, **[9]** and **[*]** keys of the handset (A-1) simultaneously until a confirmation tone is heard.

Note:

(*1) Make sure the service part no. written in the service manual if it is the compatible P.C. board.

9.3.2. For Models with 2 or More Handsets Included

- ① Replace the P.C. board (a) by the normal P.C. board (b).
- ② Register the handset (A-1) to the base unit (A).
 - Refer to **Registering a Handset** (P.58).
- ③ Reset the setting information existed in P.C. board (b).
 - Press **[1]**, **[5]**, **[9]** and **[*]** keys of the handset (A-1) simultaneously until a confirmation tone is heard.
- ④ Erase the registration information of P.C. board (b).
 - Refer to **Deregistering All Handsets by the Base Unit** (P.59).
- ⑤ Register each handset (A-1), (A-2) to the base unit (A).
 - Refer to **Registering a Handset** (P.58).

Note:

(*1) Make sure the service part no. written in the service manual if it is the compatible P.C. board.

10 Troubleshooting Guide

10.1. Troubleshooting Flowchart

Cross Reference:

Check Power (P.56)

Check Battery Charge (P.56)

Check Link (P.57)

Check the RF part (P.58)

Check Handset Transmission (P.65)

Check Handset Reception (P.65)

Check Caller ID (P.65)

10.1.1. Check Power

BASE UNIT

Cross Reference:

Power Supply Circuit (P.14)

Reset Circuit (P.16)

Note:

DSP is IC501.

(*1) Refer to **Specifications** (P.6) for part number and supply voltage of AC adaptor.

(*2) Refer to **Circuit Board (Base Unit_Main)** (P.91).

10.1.2. Check Battery Charge

BASE UNIT

HANDSET

CHARGER UNIT

Note:

(*1) Refer to **Specifications** (P.6) for part number and supply voltage of AC adaptor.

10.1.3. Check Link

BASE UNIT

HANDSET

Note:

DSP is IC501.

(*1) Refer to **Finding out the Defective part** (P.58).

Cross Reference:

Check the RF part (P.58)

10.1.4. Check the RF part

10.1.4.1. Finding out the Defective part

1. Prepare Regular HS(*1) and Regular BU(*2).
2. a. Re-register regular HS (Normal mode) to base unit (to be checked).
If this operation fails in some ways, the base unit is defective.
- b. Re-register handset (to be checked) to regular BU (Normal mode).
If this operation fails in some ways, the handset is defective.

After All the Checkings or Repairing

1. Re-register the checked handset to the checked base unit, and Regular HS to Regular BU.

Note:

- (*1) HS: Handset
(*2) BU: Base Unit

10.1.4.1.1. Registering a Handset

The included handset and base unit are preregistered. If for some reason the handset is not registered to the base unit, register the handset.

1 Handset:

[MENU] → [0][0][1]

2 Base unit:

Press and hold [LOCATOR] until the IN USE indicator flashes.

- After the IN USE indicator starts flashing, the rest of the procedure must be completed within 1 minute.

3 Handset:

Press [OK], then wait until a beep sounds.

4 [OFF]

Registering an additional handset

Start from step 2.

10.1.4.1.2. Deregistering a Handset

1 [MENU] → [0][0][2]

2 [3][3][5] → [OK]

3 Select the handset you want to cancel by pressing the desired handset number ([1] – [4]).

10.1.4.1.3. Deregistering All Handsets by the Base Unit

Base unit:

- 1** Connect the AC adaptor cord while pressing **[LOCATOR]**, then IN USE indicator flashes.
- 2** Press and hold **[LOCATOR]** again till IN USE indicator stops flashing.

Important:

When deregistering all handsets by the base unit, the registration information of all handsets in the base unit is erased.
However the registration information in each handset will still remain.

10.1.4.2. RF Check Flowchart

Each item (1 ~ 6) of RF Check Flowchart corresponds to **Check Table for RF part** (P.61).

Please refer to the each item.

Note:

(*1) Refer to **Things to Do after Replacing IC or X'tal** (P.75)

10.1.4.3. Check Table for RF part

No.	Item	BU (Base Unit) Check	HS (Handset) Check
1	Link Confirmation Normal HS, BU Mode [Normal Mode]	1. Register Regular HS to BU (to be checked). 2. Press [Talk] key of the Regular HS to establish link.	1. Register HS (to be checked) to Regular BU. 2. Press [Talk] key of the HS to establish link.
2	Control signal confirmation HS, BU Mode: [Test Burst Mode] (*1)	Check DSP interface. (*2)	Check DSP interface. (*2)
3	X'tal Frequency confirmation (*7) HS, BU Mode: [Adjustment] (*3)	Check X'tal Frequency. (13.824000 MHz $\pm$ 100 Hz)	Check X'tal Frequency. (13.824000 MHz $\pm$ 100 Hz)
4	TX Power confirmation Regular HS, BU Mode: [RX-CW Mode.] (*4) HS, BU (to be checked) Mode: [Test Burst Mode.] (*1)	1. Place the Regular HS about 15 cm away from the BU. 2. Confirm that RSSI of the Regular HS is approximately 2 V by Oscilloscope. (*5)	1. Place the HS about 15 cm away from the Regular BU. 2. Confirm that RSSI of the Regular BU is approximately 2 V by Oscilloscope. (*6)
5	RX Sensitivity confirmation Regular HS, BU Mode: [Test Burst Mode.] (*1) HS, BU (to be checked) Mode: [RX-CW Mode.] (*4)	1. Place the Regular HS about 15 cm away from the BU. 2. Confirm that RSSI of the BU is approximately 2 V by Oscilloscope. (*5)	1. Place the HS about 15 cm away from the Regular BU. 2. Confirm that RSSI of the HS is approximately 2 V by Oscilloscope. (*6)
6	Range Confirmation Normal HS, BU Mode: [Normal Mode]	1. Register Regular HS to BU (to be checked). 2. Press [Talk] key of the Regular HS to establish link. 3. Compare the range of the BU (being checked) with that of the Regular BU.	1. Register HS (to be checked) to Regular BU. 2. Press [Talk] key of the HS to establish link. 3. Compare the range of the HS (being checked) with that of the Regular HS.

Note:

- (*1)(*3)(*4) **Test Mode** (P.40)
- (*2) **RF-DSP Interface Signal Wave Form** (P.63)
- (*5) **Base Unit Reference Drawing** (P.76)
- (*6) **Handset Reference Drawing** (P.78)
- (*7) **Things to Do after Replacing IC or X'tal** (P.75)

10.1.4.4. TEST RANGE Check

Circuit block which range is defective can be found by the following check.

Item	BU (Base Unit) Check	HS (Handset) Check
Range Confirmation TX TEST (TX Power check) HS, BU Mode: [Test Link Mode] (*1)	1. Register Regular HS to BU (to be checked). 2. Set BU to "Test Link mode". 3. Set Regular HS to "Test Link mode". *Set TX Power and RX Sensitivity of the BU and the Regular HS by CHART1. * At distance of about 20 m between HS and BU, Link OK = TX Power of the BU is OK. No Link = TX Power of the BU is NG.	1. Register HS (to be checked) to Regular BU. 2. Set Regular BU to "Test Link mode". 3. Set HS to "Test Link mode". *Set TX Power and RX Sensitivity of the HS and the Regular BU by CHART1. * At distance of about 20 m between HS and BU, Link OK = TX Power of the HS is OK. No Link = TX Power of the HS is NG.
Range Confirmation RX TEST (RX sensitivity check) HS, BU Mode: [Test Link Mode] (*1)	1. Register Regular HS to BU (to be checked). 2. Set BU to "Test Link mode". 3. Set Regular HS to "Test Link mode". *Set TX Power and RX Sensitivity of the BU and Regular HS by CHART1. * At distance of about 20 m between HS and BU, Link OK= RX Sensitivity of the BU is OK. No Link = RX Sensitivity of the BU is NG.	1. Register HS (to be checked) to Regular BU. 2. Set Regular BU to "Test Link mode". 3. Set HS to "Test Link mode". * Set TX Power and RX Sensitivity of Checking_HS and Regular_BU by CHART1. * At distance of about 20 m between HS and BU, Link OK= RX Sensitivity of the HS is OK. No Link = RX Sensitivity of the HS is NG

CHART1: Setting of TX Power and RX Sensitivity in Range Confirmation TX TEST, RX TEST

	BU (to be checked)		Regular_HS	
	TX Power	RX Sens.	TX Power	RX Sens.
BU (Base Unit) TX Power Check	High	High	High	Low
BU (Base Unit) RX Sensitivity Check	High	High	Low	High

	HS (to be checked)		Regular_BU	
	TX Power	RX Sens.	TX Power	RX Sens.
HS (Handset) TX Power Check	High	High	High	Low
HS (Handset) RX Sensitivity Check	High	High	Low	High

Note:

(*1) **Test Mode** (P.40)

10.1.4.5. RF-DSP Interface Signal Wave Form

Test Burst Mode

Test Burst Mode

10.1.5. Check Handset Transmission

Cross Reference:
Signal Route (P.30)

10.1.6. Check Handset Reception

Cross Reference:
Signal Route (P.30)

Note:
 When checking the RF part, Refer to **Check the RF part** (P.58).

10.1.7. Check Caller ID

BASE UNIT

Cross Reference:
Telephone Line Interface (P.17)
Calling Line Identification (Caller ID) (P.19)

Note:

- Make sure the format of the Caller ID or Call Waiting Caller ID services of the Telephone company that the customer subscribes to.
- It is also recommended to confirm that the customer is really a subscriber of the service.

10.2. How to Replace the Flat Package IC

10.2.1. Preparation

- PbF (: Pb free) Solder

- Soldering Iron

Tip Temperature of 700°F ± 20°F (370°C ± 10°C)

Note: We recommend a 30 to 40 Watt soldering iron. An expert may be able to use a 60 to 80 Watt iron where someone with less experience could overheat and damage the PCB foil.

- Flux

Recommended Flux: Specific Gravity → 0.82.

Type → RMA (lower residue, non-cleaning type)

Note: See **About Lead Free Solder (PbF: Pb free)** (P.4).

10.2.2. How to Remove the IC

1. Put plenty of solder on the IC pins so that the pins can be completely covered.

Note:

If the IC pins are not soldered enough, you may give pressure to the P.C. board when cutting the pins with a cutter.

2. Make a few cuts into the joint (between the IC and its pins) first and then cut off the pins thoroughly.

3. While the solder melts, remove it together with the IC pins.

When you attach a new IC to the board, remove all solder left on the board with some tools like a soldering wire. If some solder is left at the joint on the board, the new IC will not be attached properly.

10.2.3. How to Install the IC

1. Temporarily fix the FLAT PACKAGE IC, soldering the two marked pins.

*Check the accuracy of the IC setting with the corresponding soldering foil.

2. Apply flux to all pins of the FLAT PACKAGE IC.

3. Solder the pins, sliding the soldering iron in the direction of the arrow.

10.2.4. How to Remove a Solder Bridge

1. Lightly resolder the bridged portion.
2. Remove the remaining solder along the pins using a soldering iron as shown in the figure below.

10.3. How to Replace the LLP (Leadless Leadframe Package) IC

10.3.1. Preparation

- PbF (: Pb free) Solder
- Soldering Iron
Tip Temperature of 700°F ± 20°F (370°C ± 10°C)

Note:

We recommend a 30 to 40 Watt soldering iron. An expert may be able to use a 60 to 80 Watt iron where someone with less experience could overheat and damage the PCB foil.

- Hot Air Desoldering Tool
Temperature: 608°F ± 68°F (320°C ± 20°C)

10.3.2. Caution

- To replace the IC efficiently, choose the right sized nozzle of the hot air desoldering tool that matches the IC package.
- Be careful about the temperature of the hot air desoldering tool not to damage the PCB and/or IC.

10.3.3. How to Remove the IC

1. Heat the IC with a hot air desoldering tool through the P. C. board.

2. Pick up the IC with tweezers, etc. when the solder is melted completely.

Note:

- Be careful not to touch the peripheral parts with tweezers, etc. They are unstable.

When it is hard to melt the solder completely, heat it with a hot air desoldering tool through the IC besides through the P. C. board.

3. After removing the IC, clean the P. C. board of residual solder.

10.3.4. How to Install the IC

1. Place the solder a little on the land where the radiation GND pad on IC bottom is to be attached.

2. Place the solder a little on the land where IC pins are to be attached, then place the IC.

Note:

- When placing the IC, the positioning should be done very carefully.

3. Heat the IC with a hot air desoldering tool through the P. C. board until the solder on IC bottom is melted.

Note:

- Be sure to place it precisely, controlling the air volume of the hot air desoldering tool.

4. After soldering, confirm there are no short and open circuits with visual inspection.

10.3.5. How to Remove a Solder Bridge

When a solder bridge is found after soldering the bottom of the IC, remove it with a soldering iron.

11 Disassembly and Assembly Instructions

11.1. Disassembly Instructions

11.1.1. Base Unit

- ① Remove the 3 screws to remove the cabinet cover.

- ② Remove the 2 screws to remove the jack holder.

- ③ Remove the solders to remove the main P.C. board.

- ④ Remove the solders to remove the antenna P.C. board.

11.1.2. Handset

- ① Remove the 2 screws.

- ② Insert a JIG (PQDJ10006Y) between the cabinet body and the cabinet cover, then pull it along the gap to open the cabinet.

- ③ Likewise, open the other side of the cabinet.

- ④ Remove the cabinet cover by pushing it upward.

- ⑤ Remove the 2 screws to remove the 2 charge terminals.

- ⑥ Remove the screw, tape and solders to remove the main P. C. board.

11.1.3. Charger Unit

- ① Remove the screw to remove the cabinet cover.

- ② Detach the 2 hooks to remove the main P.C. board.

11.2. How to Replace the Handset LCD

①

Remove the tape and peel off the FFC (Flexible Flat Cable) from the LCD, in the direction of the arrow. Take care to ensure that the foil on the P.C. board is not damaged.

②

Fit the heatseal of a new LCD.

③

Heatweld with the tip of the soldering iron about 5 to 8 seconds (in case of 60W soldering iron).

④

Stick the tape over the heatseal. Use the tape removed in step 1.

11.3. Antenna soldering work

Preparation

- PbF (: Pb free) Solder
- Soldering Iron

Tip Temperature of 700°F ± 20°F (370°C ± 10°C)

Note:

We recommend a 30 to 40 Watt soldering iron.

Solder the antenna P.C. board as below.

Solder here (3 points)

12 Measurements and Adjustments

12.1. Things to Do after Replacing IC or X'tal

12.1.1. Preparation

Equipment: Frequency counter

Check Point for measurement: BCK

Checking tolerance: 13.824 MHz $\pm$ 100 Hz (Base Unit)/13.824 MHz $\pm$ 100 Hz (Handset)

12.1.2. Check and Adjust Frequency (Base Unit)

1. Set up base unit in TEST mode.
2. Press following keys in order to Adjust Crystal mode. [LOCATOR], [LOCATOR], [LOCATOR], [Button 1] (*1), [Button 2] (*1), [Button 2] (*1), [Button 1] (*1). Check BCK frequency.
3. If the BCK frequency is out of the checking tolerance ($\pm$ 100 Hz), adjust to Adjustment tolerance ($\pm$ 30 Hz) by pressing [Button 1] (*1) or [Button 2] (*1) key.
Adjustment Tolerance: 13.824 MHz $\pm$ 30 Hz
4. Press [LOCATOR] key to write the new frequency factor in Memory.
5. Turn the power off. Then this value is available.

Note:

(*1) When you check test mode, connect to the external Buttons because base unit has only LOCATOR key. Refer to "For Test Mode" in **Base Unit Reference Drawing** (P.76). -Insert AC adaptor during checking.

Cross Reference:

Adjustment Mode for Base Unit (P.44)

12.1.3. Check and Adjust Frequency (Handset)

1. Set DC power supply to 3.9 V.
2. Set up handset in TEST mode (Adjustment flow).
3. Press [1] key to Adjust Crystal mode ("Clock Adj." is displayed on LCD). Check BCK frequency.
4. If the BCK frequency is out of the checking tolerance ($\pm$ 100 Hz), adjust to Adjustment tolerance ($\pm$ 30 Hz) by pressing [$\blacktriangle$] or [$\blacktriangledown$] key.
Adjustment Tolerance: 13.824 MHz $\pm$ 30 Hz
5. Press [TALK] key to write the new frequency factor in EEPROM.
6. Turn the power off. Then this value is available.

Cross Reference:

Adjustment Mode for Handset (P.49)

12.1.4. Adjust Battery Low Detector Voltage (Handset)

After handset's DSP (IC501) or EEPROM (IC541) replacement, Re-writing Battery Low voltage to EEPROM is required. With following handset Adjustment Flow, adjust DC power supply and DC voltmeter by the procedure below.

1. Set DC power supply to 3.9 V.
2. Set up handset in TEST mode (Adjustment flow).
3. Press [1] key and [OFF] key to Adjust Batt Low mode. ("Bat Adj." is displayed on LCD)
4. Change the voltage of the DC power supply to 3.51 V accurately. Check the voltage at P.C. board pads because some voltage drops occur due to the usage of long or thin cables.
5. Press [TALK] key twice to write voltage value in EEPROM.
6. Press [TALK] key twice to write charge value 1 in EEPROM.
7. Change the voltage of the DC power supply to 4.50 V accurately.
8. Press [TALK] key twice to write charge value 2 in EEPROM.
9. Turn the power off. Then this value is available.

Note:

Refer to **Handset Reference Drawing** (P.78) for connection of DC power supply and voltmeter.

Cross Reference:

Adjustment Mode for Handset (P.49)

12.2. Base Unit Reference Drawing

When connecting the simulator equipment for checking, please refer to below.

12.2.1. Component View

Note:

(*1) is referred to No.3 of **Check Table for RF part** (P.61).

12.2.2. Flow Solder Side View

12.3. Handset Reference Drawing

When connecting the simulator equipment for checking, please refer to below.

Note:

(*1) is referred to No.3 of **Check Table for RF part** (P.61).

16.4. Accessories and Packing Materials

16.4.1. KX-TG3521BXB/BXS

Note:

(*1) These pads are pieces of Ref No. P3 (GIFT BOX).

16.4.2. KX-TG3522BXB/BXS

Note:

(*1) These pads are pieces of Ref No. P104 (GIFT BOX).

16.4.3. KX-TGA351BXB/BXS

Note:

(*1) This pad is a piece of Ref No. P203 (GIFT BOX).

16.5. Replacement Parts List

Note:

1. RTL (Retention Time Limited)

The marking (RTL) indicates that the Retention Time is limited for this item.

After the discontinuation of this assembly in production, the item will continue to be available for a specific period of time. The retention period of availability depends on the type of assembly and the laws governing parts and product retention.

At the end of this period, the assembly will no longer be available.

2. Important safety notice

Components identified by the Δ mark indicates special characteristics important for safety. When replacing any of these components, only use specified manufacture's parts.

3. The S mark means the part is one of some identical parts.

For that reason, it may be different from the installed part.

4. ISO code (Example: ABS-94HB) of the remarks column shows quality of the material and a flame resisting grade about plastics.

5. RESISTORS & CAPACITORS

Unless otherwise specified;

All resistors are in ohms (Ω) K=1000 Ω , M=1000k Ω

All capacitors are in MICRO FARADS (μ F) P= μ F

*Type & Wattage of Resistor

Type

ERC:Solid	ERX:Metal Film	PQ4R:Chip

16.5.1.2. Main P.C. Board Parts

Note:

(*1) When you have replaced IC501, IC611 or X501, make adjustments. Refer to **Check and Adjust Frequency (Base Unit)** (P.75).

(*2) When replacing IC701, refer to **How to Replace the LLP (Leadless Leadframe Package) IC** (P.68).

16.5.2.2. Main P.C.Board Parts

Note:

- (*1) When you have replaced IC501, IC541 or X501, make adjustments. Refer to **Check and Adjust Frequency (Handset)** (P.75) and **Adjust Battery Low Detector Voltage (Handset)** (P.75).
- (*2) When replacing IC701, refer to **How to Replace the LLP (Leadless Leadframe Package) IC** (P.68).
- (*3) When replacing the handset LCD, See **How to Replace the Handset LCD** (P.73).
